## Constant-domain Modal Logics

A constant-domain model is an ordered sextuple $<\mathrm{W}, \mathrm{R}, \mathrm{U}, \mathrm{N}, \mathrm{I}, @>$, where:

W is the set of worlds;
$\mathrm{R} \subseteq \mathrm{W} \times \mathrm{W}$ is the accessibility relation;
U , which is nonempty, is the universe;
N , the naming function, takes constants to members of U ;
I , the interpretation function, takes pairs $<\mathrm{R}, \mathrm{w}\rangle$, where R is an n-place predicate and $\mathrm{w} \in \mathrm{W}$, to a set of n -tuples from w , subject to the condition that $<=, \mathrm{w}>=$ $\{<\mathrm{x}, \mathrm{x}\rangle: \mathrm{x} \in \mathrm{W}\}$; and
( $\in \mathrm{W}$ is the actual world.

A variable assignment assigns an element of W to every world.
$\sigma$ satisfies $\mathrm{R}\left(\tau_{1}, \tau_{2}, \ldots, \tau_{\mathrm{n}}\right)$ in wiff $<\mathrm{b}_{1}, \mathrm{~b}_{2}, . ., \mathrm{b}_{\mathrm{n}}>\in \mathrm{I}(\mathrm{R}, \mathrm{w})$, where $\mathrm{b}_{\mathrm{i}}=\mathrm{N}\left(\tau_{\mathrm{i}}\right)$ if $\tau_{\mathrm{i}}$ is a constant, $\sigma\left(\tau_{\mathrm{i}}\right)$ if $\tau_{\mathrm{i}}$ isa variable.
$\sigma$ satisfies a disjunction in a world iff it satisfies one or both disjuncts in that world, a conjunction iff it satisfies both conjuncts, and a negation iff it fails to satisfy the negatum.
A $v_{i}$-variant of $\sigma$ is a variable assignment that agrees with $\sigma$ except possibly in the value it assigns to $\mathrm{v}_{\mathrm{i}}$.
$\sigma$ satisfies $\left(\forall v_{\mathrm{i}}\right) \varphi$ in w iff every $\mathrm{v}_{\mathrm{i}}$-variant of $\sigma$ satisfies $\varphi \mathrm{w}$.
$\sigma$ satisfies $\left(\exists \mathrm{v}_{\mathrm{i}}\right) \varphi$ in w iff some $\mathrm{v}_{\mathrm{i}}$-variant of $\sigma$ satisfies $\varphi$ in w.
$\sigma$ satisfies $\square \varphi$ in wiff $\sigma$ satisfies $\varphi$ in every world v with $w R v$.
$\sigma$ satisfies $\diamond \varphi$ in w iff $\sigma$ satisfies $\varphi$ in some world v with w R v .
A sentence is true in w iff it's satisfied by every variable assignment, false in w iff it's satisfied by none of them. A sentence is true in the model iff it's true in @.

Axioms for models with constant domain are sentences of the following forms:
(K)
$\square(\varphi \rightarrow \psi) \rightarrow(\square \varphi \rightarrow \square \psi)$
$(\forall$ Dist $) \quad\left(\forall v_{\mathrm{i}}\right)(\varphi \rightarrow \psi) \rightarrow\left(\left(\forall \mathrm{v}_{\mathrm{i}}\right) \varphi \rightarrow\left(\forall \mathrm{v}_{\mathrm{i}}\right) \psi\right)$
(US) $\quad\left(\forall \mathrm{v}_{\mathrm{i}}\right) \varphi\left(\mathrm{v}_{\mathrm{i}}\right) \rightarrow \varphi(\mathrm{c})$
(Vac) $\quad\left(\varphi \leftrightarrow\left(\forall v_{i}\right) \varphi\right), \mathrm{v}_{\mathrm{i}}$ not free in $\varphi$
$(\exists \operatorname{Def}) \quad\left(\exists \mathrm{v}_{\mathrm{i}}\right) \varphi\left(\mathrm{v}_{\mathrm{i}}\right) \leftrightarrow \sim\left(\forall \mathrm{v}_{\mathrm{i}}\right) \sim \varphi\left(\mathrm{v}_{\mathrm{i}}\right)$
(Ref=) $\quad \mathrm{c}=\mathrm{c}$
$(\mathrm{Sub}=) \quad(\mathrm{c}=\mathrm{d} \rightarrow(\varphi(\mathrm{c}) \leftrightarrow \varphi(\mathrm{d}))$
(BF) $\quad\left(\forall \mathrm{v}_{\mathrm{i}}\right) \square \varphi \rightarrow \square\left(\forall \mathrm{v}_{\mathrm{i}}\right) \varphi$
( $\square \neq$ ) $\quad \sim v_{i}=v_{j} \rightarrow \square \sim v_{i}=v_{j}$
Rules:
TC
Nec

A sentence is a theorem of logic iff it's derivable from the axioms by the rules. We want to show that a sentence is a theorem of logic if and only if it is true in every model. First some preliminaries:
$(\square=)$, which is $(\square \neq)$ with " $\neq$ " replaced by " $=$," is derivable:

| 1 | $\mathrm{v}_{\mathrm{i}}=\mathrm{v}_{\mathrm{i}}$ | $($ Ref $=)$ |
| :--- | :--- | :--- |
| 2 | $\square \mathrm{v}_{\mathrm{i}}=\mathrm{v}_{\mathrm{i}}$ | Nec 1 |
| 3 | $\mathrm{v}_{\mathrm{i}}=\mathrm{v}_{\mathrm{j}} \rightarrow\left(\square \mathrm{v}_{\mathrm{i}}=\mathrm{v}_{\mathrm{i}} \leftrightarrow \square \mathrm{v}_{\mathrm{i}}=\mathrm{v}_{\mathrm{j}}\right)$ | (Sub=) |
| 4. | $\mathrm{v}_{\mathrm{i}}=\mathrm{v}_{\mathrm{j}} \rightarrow \square \mathrm{v}_{\mathrm{i}}=\mathrm{v}_{\mathrm{j}}$ | TC 2, 3 |

$(\mathrm{CBC})$, the converse of $(\mathrm{BC})$ is derivable:

| 1. | $(\forall \mathrm{x}) \varphi(\mathrm{x}) \rightarrow \varphi(\mathrm{c})$ | (US) |
| :--- | :--- | :--- |
| 2. | $\square(\forall \mathrm{x}) \varphi(\mathrm{x}) \rightarrow \varphi(\mathrm{c})$ | Nec 1 |
| 3. | $\square(\forall \mathrm{x}) \varphi(\mathrm{x}) \rightarrow \square \varphi(\mathrm{c})$ | K 2 |
| 4. | $(\forall \mathrm{x})(\square(\forall \mathrm{x}) \varphi(\mathrm{x}) \rightarrow \square \varphi(\mathrm{x}))$ | UG 3 |
| 5. | $((\forall \mathrm{x}) \square(\forall \mathrm{x}) \varphi(\mathrm{x}) \rightarrow(\forall \mathrm{x}) \square \varphi(\mathrm{x}))$ | From 4 by ( $\forall$ Dist $)$ and TC |
| 6. | $\square(\forall \mathrm{x}) \varphi(\mathrm{x}) \leftrightarrow(\forall \mathrm{x}) \square(\forall \mathrm{x}) \varphi(\mathrm{x}))$ | (Vac) |
| 7. | $\square(\forall \mathrm{x}) \varphi(\mathrm{x}) \rightarrow(\forall \mathrm{x}) \square \varphi(\mathrm{x})$ | TC 5, 6 |

The Barcan formula, (BF), isn't derivable from the other axioms, but it would be derivable if we expanded our axiom system to include (B): the proof is due to Arthur Prior:

1. $(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow \square \varphi(\mathrm{c})$
2. $\sim \square \varphi(\mathrm{c}) \rightarrow \sim(\forall \mathrm{x}) \square \varphi(\mathrm{x})$
3. $\quad \square(\sim \square \varphi(\mathrm{c}) \rightarrow \sim(\forall \mathrm{x}) \square \varphi(\mathrm{x}))$
4. $\quad \square \sim \square \varphi(\mathrm{c}) \rightarrow \square \sim(\forall \mathrm{x}) \square \varphi(\mathrm{x}))$
5. $\quad \diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow \diamond \square \varphi(\mathrm{c})$
6. $\diamond \square \varphi(\mathrm{c}) \rightarrow \varphi(\mathrm{c})$
7. $\diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow \varphi(\mathrm{c})$
8. $\quad(\forall \mathrm{x})(\diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow \varphi(\mathrm{x}))$
9. $(\forall \mathrm{x}) \diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow(\forall \mathrm{x}) \varphi(\mathrm{x})$
10. $\diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \leftrightarrow(\forall \mathrm{x}) \diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x})$
11. $\diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow(\forall \mathrm{x}) \varphi(\mathrm{x})$
12. $\square(\diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow(\forall \mathrm{x}) \varphi(\mathrm{x}))$
13. $\square \diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow \square(\forall \mathrm{x}) \varphi(\mathrm{x})$
14. $(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow \square \diamond(\forall \mathrm{x}) \square \varphi(\mathrm{x})$
15. $(\forall \mathrm{x}) \square \varphi(\mathrm{x}) \rightarrow \square(\forall \mathrm{x}) \varphi(\mathrm{x})$

Define $\Gamma \vdash \varphi \operatorname{iff} \varphi$ is a tautological consequence of $\Gamma \cup\{$ theorems of logic $\}$; we say that $\varphi$ is derivable from $\Gamma$. We want to show that $\Gamma \vdash \varphi \operatorname{iff} \varphi$ is true in every model of $\Gamma$.

The proof of soundness consists, as usual, in verifying that the axioms are satisfied by every variable assignment in every world in every model and that this property is preserved by the rules. The only part of the proof that needs attention is (BF). Suppose $(\forall x) \square \varphi(x)$ is satisfied by $\sigma$ in w. Take any world $v$ accessible from w. Let $\rho$ be an "x"-variant of $\sigma$. $\rho$ satisfies $\square \varphi(x)$ in w. So $\rho$ satisfies $\varphi(x)$ in $v$. Since $\rho$ was an arbitrary "x"-variant of $\sigma, \sigma$ satisfies $(\forall x) \varphi(x)$ in v. Since v was an arbitrary world accessible from w, $\sigma$ satisfies $\square(\forall \mathrm{x}) \varphi(\mathrm{x})$ in w.

The proof of completeness uses a canonical frame construction like the one we used for normal systems for the modal sentential calculus. The worlds will be complete stories with witnesses, complete stories with the additional property that, whenever an existential sentence $(\exists \mathrm{x}) \psi(\mathrm{x})$ is in the set, there is a constant c such that $\psi(\mathrm{c})$ is in the set.

Suppose $\Gamma A \chi$. Add infinitely many new constants language, and list the constants that result a $\mathrm{c}_{0}, \mathrm{c}_{1}, \mathrm{c}_{2}, \ldots$. List the sentences of the extended language as $\xi_{0}, \xi_{1}, \xi_{2}, \ldots$.

We do this by defining a sequence $\mathrm{u}_{0} \subseteq \mathrm{u}_{1} \subseteq \mathrm{u}_{2} \subseteq \ldots$ of sets of sentences.

$$
\mathrm{u}_{0}=\Gamma .
$$

Given $u_{n}$ a finite extension of $\Gamma$ from which $\chi$ isn't derivable, define $u_{n+1}$ :
 appear in $u_{n}, \psi(x)$, or $\chi$, and let $u_{n+1}=u_{n} \cup\left\{\xi_{n}, \psi\left(c_{i}\right)\right\}$.

Let @ be the union of all the $u_{n} s$. Then @ is a complete story with witnesses that includes $\Gamma$ and the theorems of logic and excludes $\chi$.

Let W, the set of worlds, be the set of all complete stories with witnesses that include all the theorems of logic and all the identity statements and negated identity statements in @.

Define wRv iff whenever $\square \varphi$ is in $\mathrm{w}, \varphi$ is in v .
$\mathrm{N}\left(\mathrm{c}_{\mathrm{i}}\right)=$ the least number j with $\mathrm{c}_{\mathrm{i}}=\mathrm{c}_{\mathrm{j}}$ an element of $@$.
$\mathrm{U}=$ the set of all the $\mathrm{N}\left(\mathrm{c}_{\mathrm{i}}\right) \mathrm{s}$.
$<N\left(c_{i_{1}}\right), \ldots, N\left(c_{i_{m}}\right)>$ is in $I(R, w)$ iff $R c_{i_{1}} \ldots c_{i_{n}}$ is in $w$.
Now that we have our model, we conplete the completeness proof by proving what's called the truth lemma: A sentence is true in a world iff it's an element of the world. The proof is by induction on the complexity of sentences. All the steps are routine, except for this:
$\square \eta$ is in a world wiff $\eta$ is true in every world accessible from w.

The left-to-right direction is immediate. We have to prove the right-to-left. That is, we assume that $\square \eta$ isn't in the world w and show that there is a world v accessible from w in which $\eta$ is false. By inductive hypothesis, it's enough to show that is a world accessible from w that doesn't contain $\eta$. That is, we want a complete story with witnesses that contains all the theorems of logic, the identity statements and negated identity sentences in @, and includes all the
sentences $\theta$ with $\square \theta$ in $w$, and excludes $\eta$. If $\theta$ is a theorem of logic, $\square \theta$ is a theorem of $w$, by Nec, so $\square \theta$ is in w. If $\mathrm{c}=\mathrm{d}$ is in @, $\mathrm{c}=\mathrm{d}$ is in $w$, so $\square \mathrm{c}=\mathrm{d}$ is in w by ( $\square=$ ). Similarly, if $\sim \mathrm{c}=\mathrm{d}$ is in @, $\square \sim$ $\mathrm{c}=\mathrm{d}$ is in w . So it will be enough to find a complete story with witnesses v that contains all the sentences $\theta$ with $\square \theta$ in w and excludes $\eta$. We build $v$ in stages.

$$
\mathrm{v}_{0}=\{\text { sentences } \theta \text { with } \square \theta \text { in } \mathrm{w}\} .
$$

If $\eta$ were derivable from $v_{0}, \eta$ would be a tautological ${ }_{\text {consequence }}$ of $\{$ sentences $\theta$ with $\square \theta$ in $w\} \cup$ $\left\{\right.$ theorems of logic\}. If $\eta$ were derivable from $\mathrm{v}_{0}$, then by TC, Nec, and (K), $\square \eta$ would be derivable from w , and so an element of w , contrary to hypothesis.

Given $v_{n}$ a finite extension of $v_{0}$ from which $\eta$ is not derivable, define $v_{n+1}$ as follows:

How do we know there is such a $\mathrm{c}_{\mathrm{i}}$ ? Suppose otherwise, and let $\delta$ be the conjunction of the sentences in $\mathrm{v}_{\mathrm{n}} \sim \mathrm{v}_{0}$. (We've stipulated that the conjunction of the empty set is $T$.) Then for each $\mathrm{i},\left(\delta \rightarrow\left(\psi\left(\mathrm{c}_{\mathrm{i}}\right) \rightarrow \eta\right)\right)$ is derivable from $\{\theta: \square \theta \in \mathrm{w}\}$. So for each $\mathrm{i},\left(\delta \rightarrow\left(\sim \eta \rightarrow \sim \psi\left(\mathrm{c}_{\mathrm{i}}\right)\right)\right.$ is derivable from $\{\theta: \square \theta \in \mathrm{w}\}$. Consequently $\square\left(\delta \rightarrow\left(\sim \eta \rightarrow \sim \psi\left(\mathrm{c}_{\mathrm{i}}\right)\right)\right)$ is derivable from w, and so an element of w. So there is no constant c with $\sim \square(\delta \rightarrow(\sim \eta \rightarrow \sim \psi(\mathrm{c})))$ an element of w . Since w is a complete story with witnesses $(\exists \mathrm{x}) \sim \square(\delta \rightarrow(\sim \eta \rightarrow \sim \psi(\mathrm{x})))$ isn’t in w. So $(\forall \mathrm{x}) \square(\delta \rightarrow(\sim \eta \rightarrow \sim \psi(\mathrm{x})))$ is in w. By the Barcan formula, $\square(\forall \mathrm{x})(\delta \rightarrow(\sim \eta \rightarrow \sim \psi(\mathrm{x})))$ is in w , and so $(\forall \mathrm{x})(\delta \rightarrow(\sim \eta \rightarrow \sim \psi(\mathrm{x}))$ ), which is logically equivalent to $(\delta \rightarrow(\sim \eta \rightarrow(\forall \mathrm{x}) \sim \psi(\mathrm{x})))$ is in $\mathrm{v}_{0}$, $\left.\operatorname{So}(\sim \eta \rightarrow(\forall \mathrm{x}) \sim \psi(\mathrm{x}))\right)$ is derivable from $\mathrm{v}_{\mathrm{n}}$ and $\eta$ is derivable from $\mathrm{v}_{\mathrm{n}} \cup\{(\exists \mathrm{x}) \psi(\mathrm{x})\}$. Contradiction.

Finally, we take $v$ to be the union of the $v_{n} s$. It will be a world accessible from $w$ in which $\eta$ is false. $\boxtimes$

If we take our axioms and add any combination of schemata (T), (4), (B), and (5), we get a system that is sound and complete for models that satisfy the corresponding combination of being reflexive, transitive, symmetric, and transitive.
